1. Introduction and context

Marine Spatial Planning (MSP) is a "public process of analyzing and allocating the spatial and temporal distribution of human activities in marine areas to achieve ecological, economic and social objectives that have been specified through a political process" (Ehler and Douvère 2009). It can be used in the context of ecosystem-based management¹ to address both human and ecosystem needs and move from a sector-by-sector to an integrated management approach. MSP varies regionally and by country because of the differences in public policies and legislation (TNC 2009). Marine areas may have different objectives and management agencies may use different combinations of tools, including zoning (Norse 2005).

A discussion about zoning and decisions for zoning terminology are helpful before embarking on analyses to resolve spatial designations because it is important to know how the spatial designations will or could be implemented. For example, are they being implemented through legal means, i.e., regulations or legislation, or will the spatial designations be implemented through voluntary, policy or non-legal means? What is the definition of the uses or activities? Who will implement zoning? The capacity of institutions and governments to manage zoning should be evaluated to ensure implementation. At this time, there is not the capacity within the Seychelles MSP Initiative to do a capacity needs assessment thus it would be considered for the next phase of planning, or as soon as resources can be allocated.

Zoning has its origins in terrestrial planning, for example community or urban planning. Zoning in urban areas is the mechanism used by local governments to regulate the use, density and location of uses that a landowner can put on a piece of land. In the ocean, property rights and ownership are more akin to strategic land use planning rather than regulating private parcels - common property resources managed by several jurisdictions. The marine environment is extremely dynamic, especially compared to terrestrial environments, thus zones may need to be developed to account for both temporal and spatial variability (Norse 2005). Long distances may separate uses in time and space so intensity and frequency also need to be considered.

Marine spatial planning that uses zoning based on legal designations will mean that draft spatial designations are to be implemented using regulatory measures and authorized through legislation. Comprehensive zoning, such as being undertaken in the Seychelles, differs from single-use based planning such as permitting through Acts, or only creating marine protected areas (Norse 2005; Young et al 2007).

The Seychelles Marine Spatial Planning (MSP) Initiative is a process focused on planning for and management of the sustainable and long-term use and health of the Seychelles Exclusive Economic Zone, a marine area covering 1,374,000km² and encompassing the Seychelles archipelago of 115 islands. The MSP Initiative is a Government-led process, with planning and facilitation of the Initiative managed by a partnership between The Nature Conservancy (TNC) and the Government of Seychelles (GOS) - United Nations Development Programme (UNDP) - Global Environmental Facility (GEF) Programme Coordinating

¹ Ecosystem-based management is an adaptive approach to managing human activities that seeks to ensure the coexistence of healthy, fully functioning ecosystems and human communities.

Unit (PCU) - GOS/UNDP/GEF. Funding for the Initiative is being provided through a number of GOS/UNDP/GEF grants as well as an Oceans 5 grant awarded to The Nature Conservancy.

The Seychelles Marine Spatial Planning Initiative takes an integrated, multi-sector approach. The process will include input from the major sectors of the Seychelles which use the country's marine space such as fishing, tourism, conservation and petroleum development in order to develop a holistic climate-smart multi-use design, integrating the new challenges created by climate change into planning and management efforts.

This multi-use design of the Seychelles MSP Initiative will serve as the basis for guiding the strategies and decisions of the Seychelles Conservation & Climate Adaptation Trust (SeyCCAT) established as part of the Government of Seychelles-led Debt-for-Climate-Change-Adaptation swap². Phase I of the MSP Initiative (February 2014 – June 2015) will produce zoning design options, zoning tools, and draft management strategies (a draft zoning map) as a basis for further development and implementation of the national multi-use plan.

Several marine processes are underway in the Seychelles including a GOS-UNDP-GEF project 'Strengthening Seychelles' Protected Area System through NGO management modalities'³, led by Dr. Rebecca Klaus. The goal of the protected area project is to 'facilitate working partnerships between diverse government and non-government partners in the planning and management of the protected area system in Seychelles'. This protected area project will provide key outputs that will be useful for the Seychelles MSP Initiative, particularly for defining zones with objectives for biodiversity conservation, selecting new protected areas, and identifying potential conflicts amongst all uses. The process for incorporating the results of the Protected Area strategy and other planning processes underway in the Seychelles will be addressed by the MSP Initiative's Steering Committee as per the Initiative's governance model⁴.

Finally, there are government initiatives to promote sustainability in the Seychelles and other Small Island Developing States including the Blue Economy. The Seychelles have developed a concept paper for the Blue Economy⁵ (see glossary for definition) and the European Union recently announced the role of the Blue Economy to realise its goals for the Europe 2020 strategy⁶. The Seychelles is supporting the development of a 'blue economy' that will lead to a more inclusive global development agenda that emphasizes the economic growth potential of the seas while protecting maritime resources. In the Seychelles, on-going maritime security efforts can be matched by a focus on sustainability, resilience and responsibility, leading to economic prosperity for East Africa's coastal and island states⁷.

The Seychelles MSP Initiative, which includes a zoning design, is intended to incorporate, capture, or connect to other planning processes in the Seychelles (e.g., Outer Island Marine Spatial Planning), existing

management plans for fisheries (e.g., Finfish Demersal Fishery Management Plan for the Mahe Plateau) and other uses, national initiatives and policies, and international obligations including the Debt-for-Climate-Change-Adaptation swap, the GOS-UNDP-GEF Protected Area Strategy and the Blue Economy. A list of initiatives is being undertaken by the Government of Seychelles to ensure harmonisation and integration with the MSP Initiative and to avoid any conflicts arising. If these or other important initiatives are not captured, please share your comments.

The purpose of this document is to provide a short background and highlight some of the general approaches and challenges to zoning worldwide, summarise input from stakeholder engagement received to date on a vision for the Seychelles marine environment and planning needs. This is a living document and has received input from the Steering Committee, Technical Working Group, and stakeholder group (see Section 9). This zoning proposal will be used to develop a draft zoning design using spatial data layers and non-spatial information from August - December. Zoning is an iterative process (see Section 7), and an on-going aspect is to obtain the spatial locations for uses to support the development of zones and accompanying management plans. As information is provided to the MSP process, the zones will be reviewed and revised, as needed or where necessary.

2. Approaches to zoning

One of the first things to define in a zoning process is the type of zones, or defining your approach. Across the spectrum of marine and ocean plans around the world, the type and number of zones varies according to local needs, uses and activities, and enabling legislation and laws. Zones have been created to manage many activities including: recreation, education, research, cultural, park, military, mineral extraction, shipping-transport-transit, disposal, fisheries, oil and gas, cable infrastructure, anchorages-ports, fisheries, aquaculture, renewable energy, ship wrecks, and non-extractive commercial uses.

The number of zones or categories in a single marine plan has typically ranged from four to eight, with most plans having fewer than six zones in recent years. It is generally recognized that fewer zones are better than many zones for simplification of planning, management and compliance.

There are several approaches to zoning that may be appropriate for the Seychelles: use based, ecologically based, objective based and other.

a. Use based

- allocate uses based on existing or historic use patterns, or the status quo;
- *use-based* divisions such as fishing, transportation, marina;
- *single use divisions* where only one use in a particular area is permitted, all other uses are banned (likely fragile, rare, high value functions, irreplaceable areas);
- *dominant use* features a single, priority use but allow managers to permit uses compatible with the purpose of the zone or the dominant use;
- *compatible use* divisions combine uses that don't impede each other

b. Ecologically Based

- based on relative ecological importance of areas within the region, and inherent vulnerabilities of different habitats or species;
- allocate intensive use in areas that are already impacted;
- ensure neighbouring zones are compatible (transitions, buffers);

c. Objective Based

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

- objective-based divisions such as development, conservation, multi-use;
 - determine highest or best use, which could include conservation or human uses;
 - provisions can be written so as to preclude most exceptional uses, or to allow exceptional uses on a more regular basis depending on the balance needed between stability and flexibility;
- d. Other characteristics
- *vertical zoning* can consider the water column, air shed and seabed separately;
 - *temporal zoning* can vary by time of year, or be full time; or be temporary or permanent
 - *proscriptive zoning* - identifies what you cannot do. Limit the ability to set objectives enabling compatible activities;
 - *prescriptive zoning* - identifies what you can do and how. The tools also tend to be all or nothing. An activity is permitted or not. This limits the ability to set objectives for uses, to allow more flexibility to identify when an activity or use can occur.

3. Zoning examples

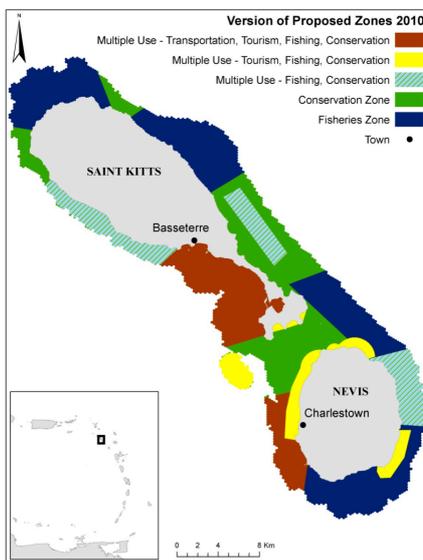

Figure 1. An example of a hybrid use-based and objective-based approach to zoning from St Kitts and Nevis, Caribbean (source: Agostini et al., 2010)

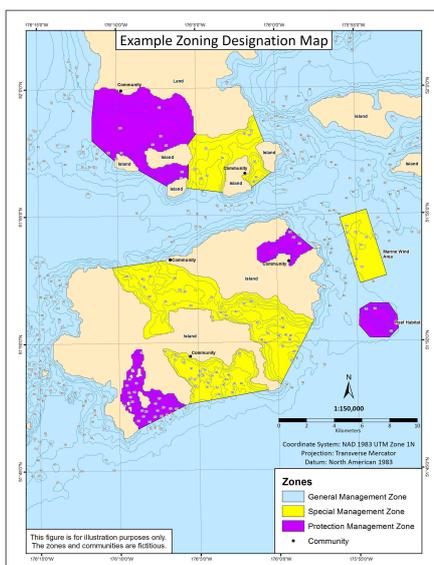

Figure 2. An example of an objective-based zoning approach from British Columbia, Canada. (source: MaPP 2013)

4. Challenges for zoning

When considering an approach, it is important to understand the challenges that may be present in the planning area to create and implement zoning. Generally speaking, zoning can be challenging to implement because of scientific, social and political obstacles (Agardy 2010 a, b). Some of these challenges arise due to:

- handling the technical, legal and political complexities of multi-objective ocean zoning;
- competing interests with different or conflicting values attached to specific locations;
- lengthy time horizons for formalising zones;
- zoning for a dynamic ecosystem;
- possible lack of legislative tools to implement zones (e.g., laws, regulations);
- lack of legal flexibility;
- discussions on property rights and resource ownership (Eagle et al., 2008; Edwards 2008);
- capacity to implement zones; and
- Integrating existing zones and/or management plans

5. Zoning in the Seychelles

I. Brainstorming zoning needs

To begin the process of determining what types of zones are appropriate in the Seychelles, a brainstorming exercise was done during workshop #2 (May 2014) to create a list of possible zones types, zone names or zone categories based on the perception of the types of activities that need zoning in the Seychelles, or that would benefit from zoning. This zoning discussion built upon a future visioning exercise that was undertaken during workshop #1 (Feb 2014), an exercise that helps to clarify answers to the question of "what are you planning for?". The resulting list of possible zones or activities to be zoned was not filtered or edited, and served as information to develop a draft zoning approach and propose zone types for the Seychelles:

- Sustainable tourism zones
- Temporal closure zones
- Renewable energy harnessing zones
- Biodiversity habitat protection zones
- Fisheries zones
- (International) shipping lanes/zones
- Recreational zones
- Expansion zones for ecosystem services; areas that may become vulnerable in the future due to climate change effects like sea level rise e.g., mangroves.
- Extraction zones for petroleum, minerals and aggregates
- Cultural zones
- Reclamation zones
- Military zones (possibly in the future).

II. Considerations for zoning

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

In addition to names for zones or zone types, additional considerations were shared for the Seychelles MSP Initiative to consider while drafting a zoning proposal. The following Seychelles-specific considerations were generated during a group discussion at workshop #2 in May 2014:

- Harmonise and integrate the zones designated or proposed under the existing and revised Fisheries Acts and Protected Areas policy
- Recognise the specific characteristics of each of the outer islands, e.g., those with lagoons as well as the integration of sustainable tourism and artisanal fisheries.
- Consider ongoing uses and measures outside the Seychelles EEZ which may impact the ecosystems, species, processes and uses within it
- Use “best zones” instead of exclusion zones, as in best use areas.
- Highlight the gaps in marine data, but do not be stalled by these
- Reflect the practicality of managing zones given the size of the EEZ and the current limited capacity for both management and enforcement. This should be reflected in the management objectives.
- Consider potential future uses (such as renewable energy), climate change impacts and ecosystems services, bearing in mind the lack of data and uncertainty surrounding these uses.
- Balance uses and priorities, including overlapping of uses can be achieved through effective stakeholder consultation that draws on inputs from the proposed Technical Working Groups.
- Evaluate the benefits of no take areas and fishery closures as management tools.

III. DRAFT zoning process

Throughout the entire zoning process, consultation and input by all stakeholders is received as per the Seychelles MSP Initiative governance framework. The zoning process proposed for the Seychelles includes both spatial and non-spatial components and consists of multiple steps. Geographic boundaries of zones will be captured and the non-spatial management directions for uses and activities within the zone will be developed. While the zoning process steps appear sequential (listed below), it is intended to be an iterative process, as the steps do not always progress linearly. Several steps may be completed simultaneously, some steps may be only partly completed because information is missing or not available at this time, and steps can be repeated or revisited as new information becomes available. Currently, steps 1-3 are underway, and this document begins steps 4-9.

Draft zoning process:

1. Review existing plans, literature, guidelines for the Seychelles
2. Review global “lessons learned”
3. Gather and review data layers for environment, existing human uses and activities, future potential uses and activities, cultural heritage, historical marine artifacts, governance and administration, and other sources relevant for the planning boundary
4. Develop a zoning process
5. Define zoning scale and scope
6. Draft zoning objectives
7. Decide upon zoning approach and develop names and types of zones
8. Clearly articulate criteria for defining the spatial extents of the zones
9. Develop spatial and non-spatial tools to support development of zones (e.g., compatibility matrix for uses and activities, web-based or interactive spatial tools to display data and sketch zone boundaries, Marxan or Marzone, Recommended Uses Table, definitions of marine uses and activities)
10. Analyse information and data for existing and future uses and activities

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

11. Draft zones, with management objectives and directions for each zone
12. Review and discuss with government, stakeholder and public
13. Assess, review and adjust zones and management directions.

IV. Zoning area, scale and scope (Step 5)

The Republic of Seychelles consists of 115 islands across 1,374,000 km² of ocean. The Seychelles archipelago is divided into two distinct geological collections: 1) the Mahé group of 43 granitic islands (with hills and mountains), and the outlying islands and 2) the coralline group of 72 or more islands that are at, or slightly above, sea level (Seychelles Statistical Bureau 2013). Zoning covers all of the marine waters (including species, habitats and ecological processes that support marine life) of the Seychelles EEZ, from 0-200 nautical miles (approximately, actual distance may be longer in some parts of the EEZ). The MSP blueprint, or draft design(s) for zones, will be small scale initially (i.e., large area, not much detail), and may be refined to larger scales (i.e., small area, detailed) as the MSP process develops, in particular for the Mahé Plateau. The planning scope is focused on seven major thematic sectors or uses, which are (in no particular order):

- Fisheries
- Tourism
- Marine Transportation and shipping (local and international)
- Renewable energy
- Biodiversity conservation
- Cultural heritage
- Extraction (petroleum, mining, aggregates, non-renewable energy).

V. DRAFT zoning objectives (Step 6)

Developing objectives for zoning clarifies the overall intention of the zones. These objectives can be used during implementation to measure the performance, or success, of the plan to achieve the intended benefits. The benefits of zoning are many, and include reducing spatial and temporal conflicts between existing and future uses, increasing business certainty, increasing business efficiencies for tenures, permits or licenses, and protecting social, cultural and ecological values or areas.

Draft objectives for zoning in the Seychelles EEZ:

- Reduce spatial conflicts among uses
- Identifying management directions for all uses
- Provide overall guidance for resource managers to increase business certainty and increase business efficiency in the Seychelles marine environment.
- Identify areas for enhanced management for cultural, ecological, and social objectives.

VI. DRAFT zoning scheme: approach, types, objectives and names (Step 7)

The proposed zoning approach for the Seychelles is to use a hybrid of "objective" and "use" based zoning, with an emphasis on identifying and defining objectives and then specifying targeted uses (see Section 2). This approach is proposed for several reasons. Firstly, a use-based approach requires quite a lot of data in order to delineate zones. At this point in the planning process, data layers for uses and activities are relatively sparse thus it is not possible to allocate space based on specific uses alone. Secondly, the vision for the Seychelles is to plan for existing and future uses. By using an objective-based zoning approach, it

will be flexible enough to include existing uses and possible future uses; zoning will be able to adapt over time to as yet unforeseen activities. Finally, an objective-based approach clearly emphasizes or identifies to the marine users, public, and resource managers the purpose of the zone. Management, enforcement and regulation of the zone can be mandated by the primary objective rather than by each individual use.

Zoning is a process with two components: spatial and non-spatial. The spatial aspects of zoning are often what people think of first however, zoning requires more than geographic boundaries on a chart or map – zoning requires management directions and/or objectives for each zone that addresses questions that will arise from users such as: What is the objective of the zone? What activities are permitted, allowable or recommended in the zone? Are there any activities that are excluded? How is the zone regulated or enforced? Who will implement the zones? The Technical Working Group noted that the capacity of institutions and governments to manage the zoned areas needs to be evaluated since there is no use zoning if capacity for implementation is lacking. At this time, there is insufficient capacity within the planning process to conduct a capacity needs assessment and is something that can be planned for the next phase of planning, or as resources are identified by the Government of Seychelles.

For the MSP Initiative, five zone types are proposed. At this time, the zones are labeled A through E, with suggested names and alternatives. Zone names will be created based on input from the Technical Working Group, Steering Committee, stakeholders and scientific or technical advisors to the process. The zone types were developed after careful consideration of advice from the stakeholder workshop in May 2014, Technical Working Group workshop in July 2014, as well as review of marine plans around the world, consideration of the challenges in implementation and governance, lessons learned from other processes, emerging economic opportunities, climate change adaptation, conservation, and balancing innovation with practicality.

In summary, the five zones proposed for the Seychelles EEZ include:

- existing zones or regulatory boundaries (e.g., port authority, protected areas)
- minimising conflicts between or among uses and activities, now and in the future
- providing business opportunities, now and in the future
- maximising opportunities for sustainable marine uses (e.g., fisheries, tourism, recreation)
- identifying links to national policy and international obligations (e.g., Blue Economy, biodiversity, climate change)
- identifying links to parallel planning processes in the Seychelles (e.g., UNDP Protected Area Strategy, UNDP Outer Islands Marine Planning, and SFA Fisheries Management Plans)

The five zones include objectives for:

- food security and fisheries
- biodiversity
- fisheries replenishment areas to support a range of fishing activities within the EEZ
- cultural heritage
- essential services and marine infrastructure
- ecosystem services
- oil, gas & mining developments
- tourism and recreation

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

At this time, it is recommended that zones encompass the 3-dimensional space of the ocean, from the sea surface to the seabed. In other words, there are not multiple zones at various depths or so-called vertical zoning. The advantage of having one zone from the surface to the sea floor is primarily for implementation. Zoning for the airshed above the ocean or in adjacent valleys is not included at this time, but could be considered in the future to address greenhouse gases, or air pollution, that affect the ocean and human communities.

The following are five proposed zones for the Seychelles EEZ, with suggested names, draft objectives and targeted uses (Table 1). The suggested names, objectives, sample management conditions, targeted uses, potential future uses and considerations are all provided for context and discussion during the review of this zoning proposal. A short list of targeted uses is included to reflect the activities that the zone is meant to plan for specifically based on the draft objective – as the objective is changed, the targeted uses may change. In addition, there will be allowable or compatible uses that could occur in a zone and still allow the Government of Seychelles to meet the objective(s) of that particular zone. The additional uses and activities that may be compatible or allowed are 'To Be Determined' (TBD) and in the coming months can be identified with the development of draft Compatibility Matrix (Section 14), Recommended Uses and Activities tables (Section 15) and discussions within the MSP process.

Table 1. Proposed zones for the Seychelles EEZ (draft version 3.2 – January 2015)

Zone	Suggested Name	Primary Objective	Targeted Uses ¹ (alphabetical)
A	<i>Food Security and Fisheries Zone</i>	To allocate space and guarantee access for food security, fisheries replenishment areas, foreign exchange earning, and income generation from fisheries, now and in the future.	<ul style="list-style-type: none"> • Artisanal fishing • Fisheries replenishment areas • Industrial fishing • Mariculture • Semi-industrial fishing

		tourism and recreation.	<ul style="list-style-type: none"> • Recreation • Sport fishing • Tourism
--	--	-------------------------	--

Zone A - Food Security and Fisheries Zone

Primary objective: To allocate space and guarantee access for food security, fisheries replenishment areas, foreign exchange earning, and income generation from fisheries, now and in the future.

The objective provides business certainty now and in the future for fisheries and aims to minimise existing or future conflicts between fisheries and other marine uses or activities. The management plan for this zone is intended to be developed in conjunction with the Seychelles Fishing Authority fisheries management plans (e.g., Finfish Demersal Fishery Management Plan for the Mahe Plateau) and be consistent with international agreements, laws and policies that pertain to fisheries and sustainable management in the Seychelles and Western Indian Ocean (e.g., Indian Ocean Tuna Commission, International Convention on Migratory Species, Blue Economy).

Management conditions

- Fisheries operating in this zone would have a management plan (approved or being drafted), to demonstrate sustainability or commitment to an ecosystem-based management approach that is consistent with Seychelles goals for a Blue Economy and other marine and coastal management
- Fisheries uses do not erode or destroy ecological integrity or ecosystem services.
- Fisheries operation occurs in compliance with all existing federal Acts, regulations and policies including permitting, licenses, and fees, as well as international laws, and international treaties or signatories

Targeted existing uses:

- Artisanal fishing (trap, net, beach seine, handline, etc.)
- Fisheries management aimed at replenishment of an area and restocking of adjacent areas
- Industrial fishing (longline and purse seine for tuna)
- Mariculture
- Semi-industrial fishing

Potential future uses:

- Fishing - new gear types or species (e.g., bottom or demersal longlining)
- Mariculture - new species or locations (e.g., long range or offshore)

Compatible uses, known or potential:

- Maritime Security
- See Recommended Uses Table for zones (*in development*)

Conflicting uses, known or potential:

- 'No-take' Marine Protected Areas
- Sport fishing (e.g., for tourism)
- Recreation fishing (e.g., for consumption)
- Oil & gas: exploration and development

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

Considerations in developing a draft zoning design:

- Rules of the road considerations for fisheries operating inside the Port Authority Boundary.
- Zone design is adaptable and considers the species distributions and movement patterns for pelagic, migratory, benthic and coastal species, as well as seasonal and weather patterns that affect fisheries activities and safety.
- Fisheries replenishment is an objective of Zone B
- The objective of this zone is to provide business opportunities related to fishing activity. Maritime safety is an objective of Zone C.
- Semi-industrial and artisanal fishing have spatial separation – semi-industrial fishing does not occur on the Mahé Plateau.
- Industrial fishing for tuna is generally a foreign-owned fishery and zoning designs will require input or communication with the Seychelles Fishing Authority, Indian Ocean Tuna Commission
- Currently, recreation and sport fishing activities can result in spatial conflicts with existing commercial fisheries. Recreation and sport fishing opportunities are the targeted uses of Zone E.
- IUU fishing - Illegal, Unreported, Unregulated. Observations and the vigilance of legal fishing vessels are an important component of at-sea surveillance for IUU fishing activity in the EEZ.
- High seas piracy affects fishing activities and the national economy. The activities in this zone depend on monitoring and enforcement activities of the Coast Guard (Zone C). Piracy is a national security issue.
- Existing conflicts exist between fishing and marine protection objectives (Marine Protected Areas), including in the Outer Islands
- The role of the Islands Development Corporation (IDC), Indian Ocean Tuna Commission (IOTC) and other bodies to inform zoning design and draft marine plans.

Zone B – Biodiversity Zone

The GOS-UNDP-GEF Protected Areas Strategy project is identifying high priority conservation areas and the outputs from that project will be used to inform the MSP zoning design. The UNDP Outer Islands Marine Plan will bring information from the MSP Initiative to inform management plans for the waters surrounding the Outer Islands. The management plan for this zone is intended to be developed in conjunction with existing Protected Areas policy and law, the Fisheries Bill, and other current initiatives.

Primary objective: To allocate space for conserving and sustaining marine biological diversity within the Seychelles EEZ including ecological processes, genes, species, populations and habitats.

Secondary objective: To plan for climate change adaptation to address sea level rise and other effects, as per commitments in the debt-for-climate adaptation swap, with a strong focus on natural carbon sinks.

Third objective: To allocate space for restoration activities that enhance biodiversity and fisheries replenishment areas.

Fourth objective: To allocate space for high value tourism that is inextricably linked to Seychelle's unique and globally significant marine biological diversity.

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

This zone type is proposed to meet the Seychelles objectives for marine protected areas and is an important component for climate change adaptation and Seychelles initiatives to support this (e.g., Dept-for-Adaptation swap⁸). Climate change is relevant for all marine waters in the Seychelles and for the entire zoning design. It is named here specifically because of the strong connections between climate change adaptation and managing species and habitats for a biodiversity and fisheries replenishment objectives. Marine protection zones may also be used to address and manage for ecosystem services however this will need more discussion to determine if the protection zone is the best place for an ecosystem services objective. In this zone, "replenishment" areas may be identified to conserve, replenish or restore economically valuable fish populations. Replenishment zones may include temporary reserves that limit harvesting or disturbance, as well as areas identified for their value to serve as sources for recruitment and spill over.

In this zone, the International Union for the Conservation of Nature (IUCN) categories for marine protected areas (Dudley 2008; Day et al, 2010) may be used to identify the level of protection once objectives for this zones, or the individual areas within this zone, are determined. The recommendations by the IUCN are to not determine the zone based on uses however the IUCN categories are sometimes used for guidance in defining areas and the level of protection that will be achieved. decisions that need to be made for this zone type include whether this zone does or does not include existing marine protected areas, or proposes new marine protections. Also, whether all areas in this zone must be considered for legal protection, or can they be managed using other tools?

Sample Management conditions

- Compatible uses must not erode, harm, destroy or degrade biological diversity or interfere with the other objectives and targeted uses for this zone.
- Allowable uses will be permitted in consultation with appropriate agencies and regulatory authorities.
- High value tourism activities are integrated into this zone, taking into account the compatibility (or lack thereof) of specific tourist activities with biodiversity and fisheries replenishment objectives (e.g., motorised versus non-motorised activities; extractive or non-extractive)

Targeted existing uses:

- Biodiversity
- Cultural heritage
- High value tourism
- Education and research

Potential future uses:

- Biotechnology (e.g., biomedical); only those with very minimal extraction and habitat alteration
- Natural carbon sinks (e.g., plants)
- Education
- Natural oxygenation
- Research

Compatible Uses, known or potential:

⁸ MSP Initiative overview: <http://www.seychellesmarinespatialplanning.com>

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

- Mariculture (may be conditional)
- Public recreation
- Restocking adjacent areas (for fisheries)
- Subsistence fisheries
- Tourism (incl. fishing)
- Other Cultural uses (need to be defined)
- See Recommended Uses Table (in development)

Conflicting uses, known or potential:

- For areas designated for the highest levels of protection, any use that alters the natural system in any way, or has unknown consequences would not be permitted or recommended for authorisation.
- Artificial carbon sinks and oxygenation.

Considerations in drafting a zoning design:

- Levels or range of biodiversity protection, including no-take areas and areas with multiple non-extractive uses
- identifying and managing for ecosystem services that support high value tourism
- Identify buffer zones with neighbouring zones – how big?
- management and enforcement of MPA boundaries, regulations and objectives: legal tools or other options
- overlap with conflicting uses, for example fishing
- migratory species and international obligations,
- UN Convention on Biological Diversity targets: Seychelle’s targets
- UNDP marine protected area strategy outputs provides extremely important inputs into the design for this zone. The MPA outputs inform boundary identification and also inform compatible uses for other zone boundaries for the other objectives.
- To inform decision-making in this zone, the MSP Technical Team may develop a reference table for decision-making. This table identifies biodiversity attributes or values from the PA project, a list of activities (low to high impact on biodiversity) and consultation levels needed for decisions. Information on the decision-making structures used by Government of Seychelles will be needed.

Zone C: Industrial and Public Utility Zone

Primary objective: To allocate space and identify the footprint for industrial activity, public utilities, national security and infrastructure.

Secondary objective: To allocate space and identify the footprint for the which supports infrastructure necessary for sustainable economic development and blue economy related activities

The uses in this zone are not easily moveable, tend to be fixed in permanent or predictable locations or routes, and tend to be regulated by national or federal authorities. Ports in the Seychelles include a large expanse of sea area and marine transportation routes. Renewable energy is included in this zone because the renewable energy technology and associated infrastructure tend to be long-term and fixed in space

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

(e.g., wind turbines, transmission cables). The Seychelles national goal is for 15% of energy to come from renewable sources by 2030⁹. The general intent is to target uses within existing areas such as those located on the east coast of Mahe, Baie Ste Anne, and La Digue.

This zone provides business certainty now and in the future for industrial activities primarily from the public sector and government, that support the Seychelles economy and community infrastructure. The purpose of this zone is to minimise existing or future conflicts between marine infrastructure and other marine uses or activities. The uses in this zone tend to be fixed in location. Infrastructure, such as hotels, that is needed for the private sector is targeted in Zone E [Multiple Use Zone].

Sample Management conditions

- Uses are permitted in this zone according to their consistency with the objective.

Targeted uses

- Disposal at-sea and dredging
- Maritime security (e.g., Coast Guard, docks)
- Marine Transportation: ferries, shipping (local and international)
- Ports, marinas, harbours, jetty, slipway, dry docking
- Power generation
- Reclamation areas
- Renewable Energy: wind
- Telecommunications
- Waste Management

Potential future uses:

- Utilities - desalination plants
- Ports - new uses

Compatible and/or Recommended Uses:

- TBD

Considerations

- marine pollution or sedimentation transport that may affect uses outside this zone
- buffer this zone for incompatible uses or activities
- Renewable energy could expand offshore. Renewable energy is normally located near the coast however proposals under the Ocean Thermal Energy Conversion (OTEC) project are considering pumping cold water from depth, an activity that would be located on the edge of the Mahe plateau.
- No harvesting or extraction in this zone could lead to a potential conflict as this area covers the east coast of Mahe which is important for artisanal fishery for multiple species with extensive fishing off these areas.
- Some activities may be allowed seasonally
- Marine invasive species (causing algal blooms)
- Threats to biodiversity

⁹ Masdar Port Victoria Wind Power Project in Seychelles: <http://www.masdar.ae/en/media/detail/seychelles-wind-farm>

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

- Aesthetic value of tourism sites compromised: zone will be devoted to lessen environment damage, pump funds to conservation
- Pollution: chemical, light, noise, dust

Zone D: Non-renewable Resources Zone

Primary objective: To allocate space and identify the footprint for oil, gas and mining development.

This zone would create business opportunities now and in the future and minimise conflicts between the petroleum industry and other uses. The zone's objectives and management plans would link or connect to Seychelles national policies for petroleum development including exploration and transportation. The uses in this zone are large-scale, are not easily moveable, depend on exploration to locate economically viable opportunities for extraction, and tend to be regulated by national or federal authorities.

Sample Management conditions

- Compliance with all existing federal Acts, regulations and policies including permitting, licenses, and fees

Targeted uses:

- Mining - Aggregates (construction industry)
- Energy - Oil exploration and development including transportation

Potential future uses:

- Energy - Gas exploration and development including transportation
- Mining - minerals and aggregates
- Mining - deep sea (polymetallics)
- Shipping - LNG (liquefied natural gas)

Compatible and/or Recommended Uses:

- Biodiversity conservation (somewhat compatible for certain species)
- Potential fisheries replenishment area for certain species

Considerations

- overlap with conflicting uses - fishing
- existing licenses and tenures
- seismic exploration results, including in areas 2,000 m depth
- marine pollution that may affect uses outside this zone
- assigned/leased oil exploration zones on the central Mahe plateau
- PetroSeychelles areas for oil prospecting (see website)
- upstream and downstream effects of activities
- shipping routes
- not compatible with industrial and pelagic fisheries (gear entanglement) during exploration/seismic
- International policies exist – eg exclusion zones
- EIA processes need to be adhered to

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

- Due to the geographical location and large expanse of the Seychelles EEZ, response time to any accidents/spills may be slow
- Need for increased/additional measures to protect sensitive environment from major accidents
- If exploration drilling occurs, how will tailings be disposed and what effect will this have on the environment

Zone E: Tourism and Recreation Zone

Primary objective: The objective of this zone is to allocate space to maximise business opportunities for tourism and recreation.

Secondary objective: The zone would create business certainty and protect non-economic values now and in the future for tourism, recreation, and appreciation of culture.

Sample Management conditions

- Uses are permitted in this zone according to their consistency with the objective.

Targeted uses:

- Coastal accommodation
- Fishing – recreation (artisanal)
- Fishing – sport (catch and release or extraction?)
- Public recreation (local population)
- Cultural activities
- Tourism
- etc.

Potential future uses:

- Global sport events
- Health tourism (detoxing)
- Tourism with a purpose (e.g. conservation etc.)

Compatible and/or Recommended Uses:

- Monitoring and research stations
- MPAs

Considerations

- Some uses in this zone are seasonal and locations may need to be secured to ensure opportunities are maintained from year to year at the time when the marine resources are used.
- existing licenses and tenures
- local tourism
- recreation by the Seychelles public vs. recreation by tourists
- recreation and sports fishing - do they belong with tourism or fisheries?
- recreational fishing is nearshore and sport fishing is both nearshore and 5 nm off the dropoff.
- socio-economic impact of sports fishing relative to recreation fishing

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

- include artisanal fisheries in this zone
- Possibility for industrial fishing boats that process fish into high value end products.
- Climate change impacts: coral reef bleaching, loss of corals and beaches, coastal degradation, change of coast line

National policies that apply to this zone: Tourism policies, Beach Control Act, Hire Craft Act, TCPA and LUP, Harbour Act , Protected Area (PA) policy and NPNCA, Lighting of Fires, Licensing Act, SSDS, Public Nuisance Act.

VII. Implementation of zoning

Developing an implementation plan is an important component of a marine spatial planning process. An implementation plan typically covers several topics including governance, financing, monitoring, and evaluations. Some ideas for implementation relative to zoning were suggested by the MSP Technical Working Group in July 2014:

- Establish a process that would monitor the implementation status of each zone periodically to ensure that each zone is meeting its intended.
- The capacity of institutions /government to manage the zoned areas needs to be evaluated since there is no use in zoning if capacity for implementation is lacking. It was assumed that a capacity need assessment would be part of the process even at this early stage; a capacity assessment would be useful during the MSP process.

VIII. Data and criteria for spatial extent of zones (Step 3 and 8)

The spatial locations of uses are needed in order to proceed with developing a draft zoning map for the Seychelles. The ecological and socio-economic members of the Technical Working Groups are asked to contribute spatial locations for their uses during and after the workshop on July 9, 2014. The MSP Technical Team is interested in the areas or locations that are important for uses, as well as areas with known or potential conflicts between uses. It is also helpful to know what areas are not important to uses, or never used, to specify that overlap between certain activities will not occur in geospatial analyses. If areas or locations cannot be specified, perhaps there are proxy data that can be used to identify important or high priority locations, for example, coral reefs for certain fisheries or tourism activities.

Some general criteria for defining the spatial extent of zones and design considerations for zoning include but are not limited to:

- jurisdictional boundaries
- existing spatial plans
- existing uses
- local knowledge
- targets (what percentage of the EEZ will the zone cover?)
- shape (are the lines straight? do they follow bathymetry or other features?)
- buffers (will zones need a buffer? which ones?)
- overlap (will zones overlap existing zonation or spatial regulations?)
- intensity (how intense is the use?)
- frequency (how often is the use?)

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

- temporal (when does the use occur?)
- spatial (where does the use occur?)

IX. Compatibility matrix - SAMPLE (Step 9)

To inform zoning, compatibilities between uses must be identified and articulated. The level of compatibility can be articulated simply as yes or no, or be provided on a relative scale from compatible, to incompatible, or by using high, medium, low (Figure 3).

Zones	Tourism	Fishing	Conservation	Industrial	Mariculture
Tourism					
Fishing					
Conservation					
Industrial					
Mariculture					

(N.B. Green = compatible, Yellow = somewhat compatible, orange = somewhat incompatible, red = entirely incompatible)

Figure 3. A simple compatibility matrix for the Grenadines, showing relative compatibility by colour code (source: Baldwin 2012).

In Seychelles, an initial draft matrix was developed by reviewing information from the Seychelles, examining matrices from other geographies (e.g., Caribbean, Canada, USA), and with input from the MSP Technical Working Group and marine stakeholders. The Seychelles compatibility matrix is being revised during the MSP process and the latest version is included here (Figure 4). A decision was made by the participants in the MSP process to have a somewhat detailed compatibility matrix that lists specific uses.

version 4.0 Date: 8 Jan 2015
 This draft has not been approved by the Seychelles MSP Initiative.
 New cell numbers - January 2015

It is possible that some uses do not overlap in space (or time), and either "no overlap" can be used, or N/A for not applicable. Once compatibilities are identified, or approximated, decision-support tools can sometimes be used, such as Marxan or Marxan with Zones (Ball et al. 2009), if there are enough spatial information for uses, and a draft map created to represent each zone. If spatial information is not available, spatial proxy information may be available or expert input from marine sectors in Seychelles may be needed to provide the best available information.

X. Descriptions for uses (Step 8)

Another planning tool that is developed during zoning is a list and description for each use or activity that is included in the compatibility matrix and zone types. A Master List of Uses and Activities is being developed and the MSP Technical Team is looking to the Government of Seychelles, MSP Technical Working Groups, stakeholder engagement workshops and others to assist with providing the correct terminology and descriptions for all of the uses that are included in the draft Seychelles marine plan (see: 'Draft Master List of Uses and Activities' report).

XI. Recommended Uses tables - SAMPLE (Step 8)

Once the zone types are determined, and the primary objective, targeted uses and management conditions drafted, other allowable are identified for each zone type. This information can be displayed in a 'Recommended Uses Table' (for example, see Table 2). A sample table has been created for illustrative purposes only; the MSP Initiative will develop the tables once the zones are described.

Table 2. Sample 'Recommended Uses Table' that identifies allowable activities by zone type, a planning tool that assists with developing management plans as well as regulation, enforcement and compliance for each zone.

Suggested Zone Name (version 1.2)	Blue Economy Zone	Protection Zone	Infrastructure Zone	Ecosystem Services Zone
Activity	A	B	C	D
Biodiversity Conservation	Allowable	Allowable	Allowable	Allowable
Ferries	Conditional	Conditional	Allowable	Conditional
Fishing - industrial tuna	Conditional	Not Allowable	Conditional	Not Allowable
Fishing - nearshore	Conditional	Conditional	Conditional	Conditional
Fishing - recreation	Conditional	Conditional	Allowable	Conditional
International shipping	Conditional	Not Allowable	Allowable	Not Allowable
Marine Aquaculture	Conditional	Not Allowable	Conditional	Conditional
Marine Protected Areas	Not Allowable	Allowable	Conditional	Allowable
Minerals and Aggregates	Conditional	Not Allowable	Conditional	Not Allowable
Petroleum extraction	Conditional	Not Allowable	Conditional	Not Allowable
Public recreation	Allowable	Conditional	Conditional	Conditional
Reclamation	Allowable	Allowable	Conditional	Conditional
Renewable Energy	Conditional	Conditional	Conditional	Conditional
Seychelles Culture	Allowable	Allowable	Conditional	Allowable
Sustainable Tourism	Allowable	Conditional	Conditional	Allowable
Research	Allowable	Allowable	Conditional	Allowable
Required	Use or activity is specifically targeted for that zone type			
Allowable	Use or activity is compatible with the objective of the zone.			
Conditional	Use or activity is conditionally compatible with the objective of the zone. Management directions would describe the conditions.			
Not Allowable	Use or activity is not compatible with the objective of the zone			
Not Applicable	The use or activity does not occur now or into the foreseeable future (1-20 years)

6. Acknowledgements and Document Development

The contents and ideas contained within the draft Zoning Proposal were developed as a result of the discussions and comments during MSP stakeholder meetings in Feb and May 2014. A draft Zoning Proposal was developed and presented to the MSP Technical Working Group in July 2014 for review and input (version 1.1). The draft proposal was revised and presented again to Technical Working Committee for review and input (version 1.2) prior to submission to the Steering Committee. The draft proposal was revised based on Technical Working Group input and presented to the MSP Steering Committee in August 2014 (version 1.3) The draft proposal was revised based on Steering Committee input and recommendations, and was presented to the stakeholder committee in August 2014 (version 2.0). The second draft was revised based on comments from stakeholders in August 2014, comments from Technical Working Group members and other meetings with stakeholders and government in October 2014 (version 3.0) and document clean up. This version of the Zoning Document was provided to the Steering Committee for reference in December 2014 (version 3.1).

- TNC - The Nature Conservancy
- UNDP - United Nations Development Programme

8. Glossary

Airshed - An area where the movement of air (and thus air pollutants) can be hindered by local geographic features such as mountains, and by weather conditions (British Columbia 2014). An airshed is a geographic area within which air pollutant concentrations tend to be similar and pollutants do not tend to mix with those in adjoining airsheds (except during windy periods) (Nelson City Council 2014).

Biodiversity - means the variability among living organisms from all sources including, inter alia, terrestrial, marine and other aquatic ecosystems and the ecological complexes of which they are part; this includes diversity within species, between species and of ecosystems (CBD 1992).

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

Blue Economy - A developing world initiative pioneered by the Small Island Developing States and relevant to all coastal states and countries with an interest in waters beyond national jurisdiction. The Blue Economy paradigm goes far beyond the concept of ocean-based economies to constitute a sustainable development framework for developing countries addressing equity in access to, development of and sharing of benefits from resources; offering scope re-investment in human development and the alleviation of crippling national debt burdens. The Blue Economy espouses the same desired outcome as the Rio +20 Green Economy initiative namely: "improved human well-being and social equity, while significantly reducing environmental risks and ecological scarcities (UNEP 2013; Seychelles 2013). Fundamental to this approach is the principle of equity for developing countries. At the core of the Blue Economy is the de-coupling of socioeconomic development from environmental degradation. For more information, see the Seychelles Concept Paper on the Blue Economy 2013 and the Blue Economy, Abu Dhabi Declaration 2014.

Carbon Sink - natural systems that absorb or take up carbon and store it. Plants are natural carbon sinks, taking up carbon dioxide during photosynthesis. The process by which natural sinks remove carbon dioxide from the atmosphere is called carbon sequestration. Carbon sequestration can also refer to a mitigation technique to store carbon dioxide and/or other forms of carbon to defer or avoid climate changes (e.g., iron fertilisation and ocean storage).

Climate change adaptation - Adjustment in natural or human systems in response to actual or expected climatic stimuli or their effects, which moderate harm or exploit beneficial opportunities (IPCC 2007)

Compatibility matrix - A commonly used planning tool to assist planning bodies and decision-makers in determining whether a use, or activity, should occur in a geographical area or space (Ehler and Douvere 2009).

Conservation - The maintenance or sustainable use of the Earth's resources in order to maintain ecosystem, species and genetic diversity and the evolutionary and other processes that shapes them (CBD 1992).

Ecosystem-based management - Ecosystem-based management is an adaptive approach to managing human activities that seeks to ensure the coexistence of healthy, fully functioning ecosystems and human communities. The intent is to maintain those spatial and temporal characteristics of ecosystems such that component species and ecological processes can be sustained, and human well-being supported and improved (Foley et al. 2010).

Ecosystem services - The benefits people obtain from ecosystems, including provisioning services, such as food and water; regulating services such as the regulation of floods, drought, land degradation, and disease; supporting services such as soil formation and nutrient cycling; and cultural services such as recreational, spiritual, religious and other nonmaterial benefits (Hassan et al. 2005).

Mapping Ocean Wealth - A process to describe and quantify the natural benefits of the ocean to people. A process moving from broad global averages to specific local details, evaluating nature as an asset and incorporating its benefits into all coastal planning decisions (TNC 2014).

Marine Protected Area (MPA) - A clearly defined geographic space that is recognised, dedicated and managed through legal or other effective means to achieve the long-term conservation of nature with associated ecosystem services, heritage resources, First Nations cultural resources (Laffoley 2008).

GLOBAL ENVIRONMENT FACILITY
INVESTING IN OUR PLANET

Seychelles Marine Spatial Planning Initiative
www.seychellesmarinespatialplanning.com

Marine Spatial Planning (MSP) - A public process of analyzing and allocating the spatial and temporal distribution of human activities in marine areas to achieve ecological, economic and social objectives that have been specified through a political process (Ehler and Douvère 2009).

Marxan - Marxan is software that delivers decision support for conservation planning. It was designed to help inform the selection of new conservation areas for minimal cost, and facilitate the exploration of trade-offs between conservation and socio-economic objectives. Marxan can help set priorities for conservation action by highlighting those places that are likely to be important inclusions in an efficient reserve network. Marxan can also be employed as a tool for evaluating how well existing reserve networks achieve the goals of representativeness and comprehensiveness (Ball et al. 2009).

Stakeholder - All parties participating and engaged in the planning process including government agencies, marine sectors for uses and activities (e.g., aquaculture, conservation, energy, fisheries, transportation, tourism), and coastal communities.

Sustainable development - Development that meets the needs of the present without compromising the ability of future generations to meet their own needs. Sustainable development is a term that has been criticised as being ambiguous, and open to a range of interpretations, including contradictions. Sustainable development is intended to mean improving the quality of human life while living within the carrying capacity of supporting ecosystems (World Commission on Environment and Development 1987).

Sustainable harvest rate - The rate of harvest that is within an ecosystem's natural ability to recover and regenerate (Environment Canada 1995).

Sustainable use - Applicable only to renewable resources, and refers to using them at rates within their capacity for renewal. Minerals, oil, gas and coal are effectively nonrenewable and thus cannot be used sustainably. However, the length of time that these nonrenewable resources are available can be extended by recycling materials, using less of a resource to make a product, and switching to renewable substitutes (IUCN, UNEP and WWF 1991). The use of components of biological diversity in a way and at a rate that does not lead to the long-term decline of biological diversity, thereby maintaining its potential to meet the needs and aspirations of present and future generations (CBD 1992).

Zoning - Method to delineate areas of the coastal and marine environment for specific activities in time and/or space (Agardy 2010).

9. Version Tracking

Version 1.0 – Draft submitted to Technical Working Group and Steering Committee after MSP Stakeholder Workshops 1 (February 2014) and 2 (May 2014). Revised based on input. Additional review by Science Advisors to process.

Version 2.0. – Draft submitted to MSP Stakeholder Workshop 3 (August 2014). Revised based on input.

Version 3.0 – Draft submitted to Technical Working Group (October 2014).
